

1 INTRODUCTION

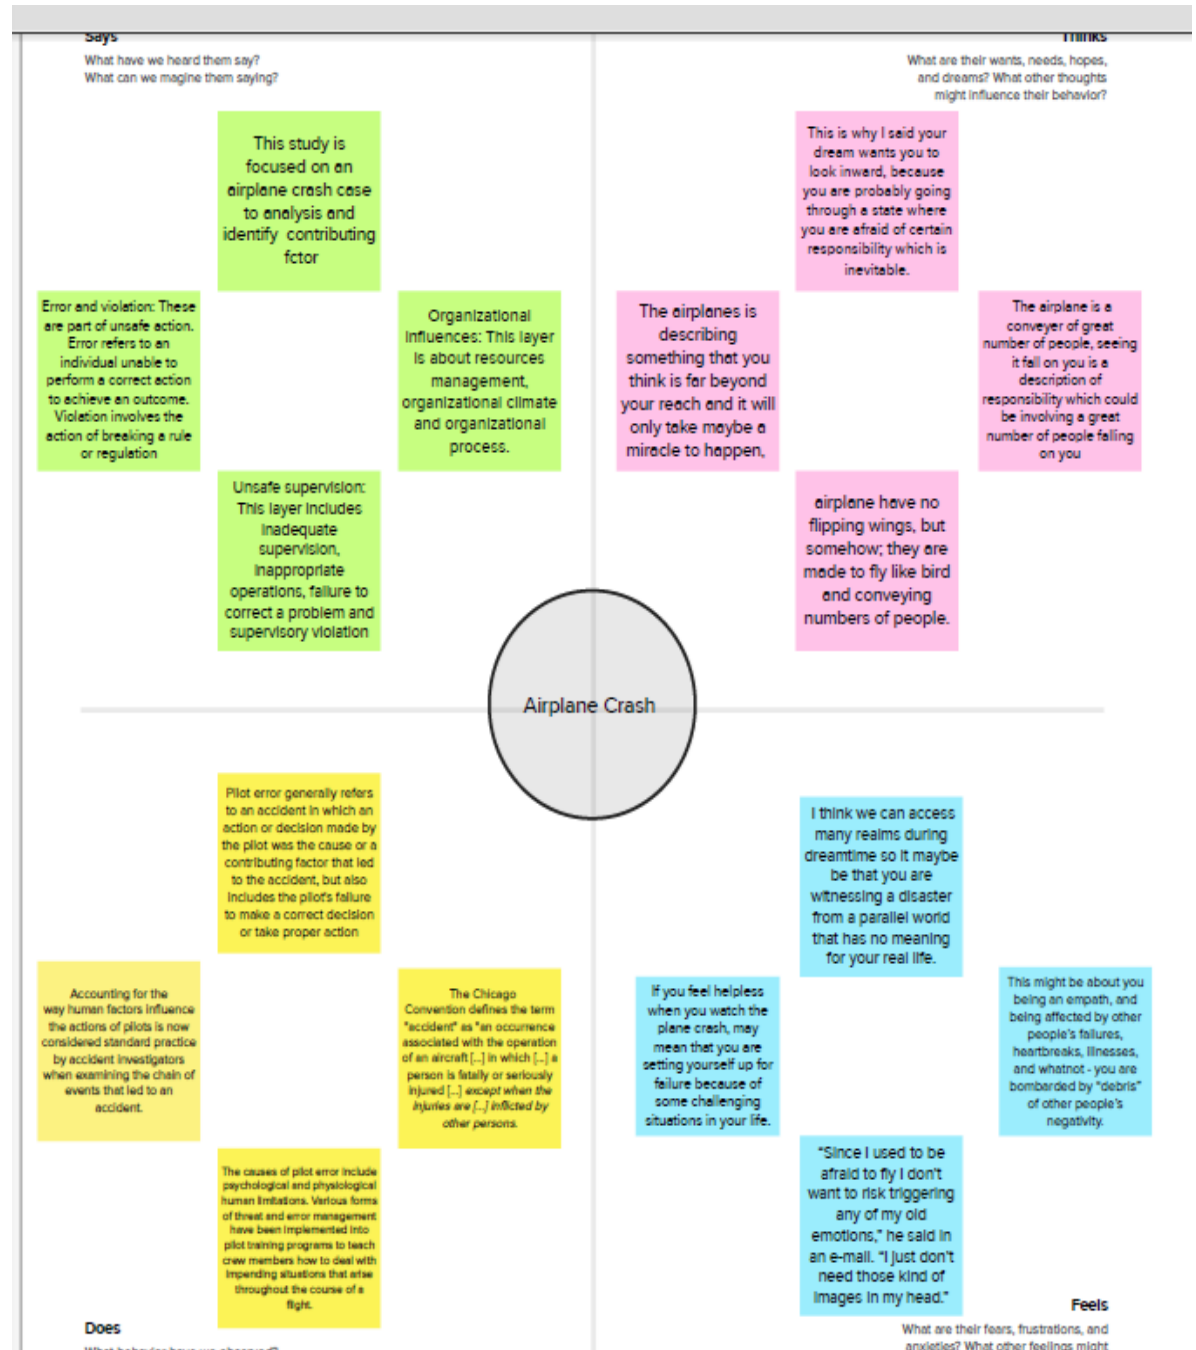

Air accident is caused due to pilot error, mechanical error, bad weather, sabotages or human error. these error can be happened any time. air accident is also called flying mischance. aeronautics misfortunes can happened at any time .flying mischance cases have a Great degree complexity .aircraft crashes cause harm to the population as it may lead to the deaths of people or may even cause Injuries to the people. crash investigation is a major research area and the major techniques used for this investigation are statistics, grid computing, cloud computing, digital image processing and data mining.

1.1 Purpose

In this project we have analyzed the various aspects of investigation into causes of accidents and incidents, and the resulting safety recommendations, help to prevent such events from re-occurring and thus play an important role in improving aviation safety. The purpose of investigations is to identify the causes of accidents, rather than to assign blame and liability.

1 PROBLEM DEFINITION AND DESIGN THINKING

1.1 Empathy Map

1.2 Ideation and brainstorming map

1

Define your problem statement

What problem are you trying to solve? Frame your problem as a How Might We statement. This will be the focus of your brainstorm.

⌚ 5 minutes

PROBLEM

Airplane crash occurs on every year regarding.

Key rules of brainstorming

To run an smooth and productive session

 Stay in topic.

 Encourage wild ideas.

 Defer judgment.

 Listen to others.

 Go for volume.

 If possible, be visual.

2

Brainstorm

Write down any ideas that come to mind that address your problem statement.

⌚ 10 minutes

Person 1

2. Choose your seat safely	Drink appropriately	Follow instructions
Stay in the area		

Person 2

Pay attention to the safety briefing	He Put Those Ninja Fight Rule	Don't comb seats
Know where the emergency exits are		

Person 3

Use the oxygen mask	Hold onto something solid	Assess the situation
Follow all safety rules and instructions. If you are trapped, do not panic. Stay calm and follow instructions.		

Person 4

Use carry on luggage to pad your legs	Pad and prepare your space	Move away from the plane
Wear your seat belt. Do not drink alcohol or use drugs. Do not use electronic devices. Do not smoke.		

3

Group ideas

Take turns sharing your ideas while clustering similar or related notes as you go. Once all sticky notes have been grouped, give each cluster a sentence-like label. If a cluster is bigger than six sticky notes, try and see if you can break it up into smaller sub-groups.

🕒 20 minutes

TIP

Add customizable tags to sticky notes to make it easier to find, browse, organize, and categorize important ideas as themes within your mural.

Pilots are skilled, highly trained individuals, and their performance is constantly being assessed. Surely they shouldn't make mistakes which result in air crashes.

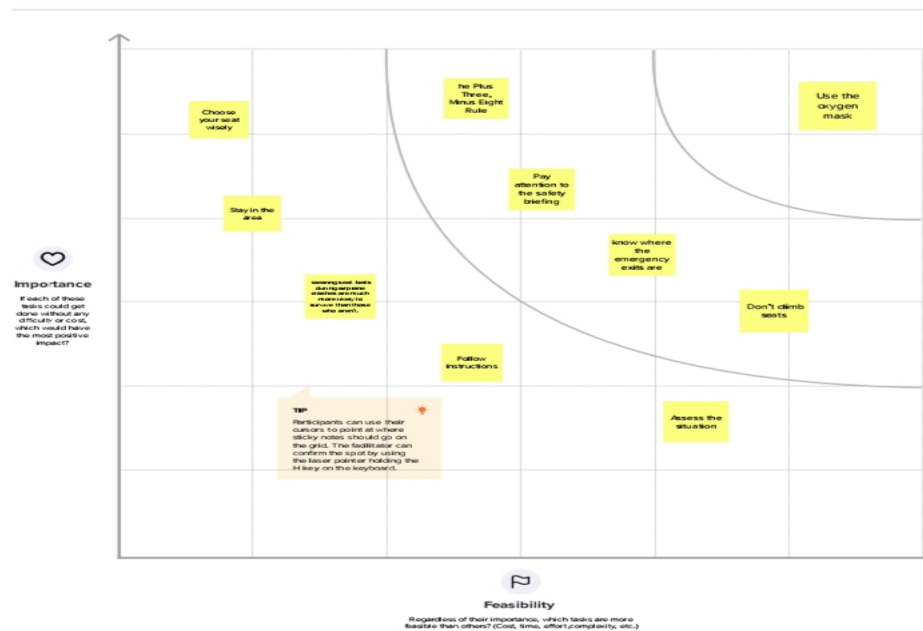

But planes are massive feats of complex engineering, and are made up of hundreds of separate systems and parts. A defect or failure in any one of these can lead to a dangerous situation

4

Prioritize

Your team should all be on the same page about what's important moving forward. Place your ideas on this grid to determine which ideas are important and which are feasible.

🕒 20 minutes

3 RESULT

- ❖ Comparing Aboard vs Fatalities vs Ground
- ❖ Max accidents based on years
- ❖ Accident happened in 1972 (MAX ACCIDENTS) based on months
- ❖ Highest No. of accidents happened by Operators
- ❖ Top 10 locations which had more accidents
- ❖ Top 10 flights which have max accidents history
- ❖ Accidents based on regions
